A: Try this - typedef unsigned __int64 unsigned_long_long; #define ULLONG_MAX ((__int64)4294967295U) #define ULLONG_MAX_2 ((unsigned_long_long)0xFFFFFFFFFFFFFFFF) If you're on a platform with a 64-bit word size, then you'll have a 64-bit type available in your compiler's native data type section. Edit: Note that the definition of uint64_t in is the correct one. (int64_t, if you insist on the type that doesn't fit in an int.) Impact of the Experimental Plasma Treatment on the Surface Characteristics and Degradation Behavior of ZnO Nanorods. Surface treatment is often considered to be a useful method to improve the mechanical and physical properties of materials. In this work, atomic force microscopy (AFM) and X-ray photoelectron spectroscopy (XPS) techniques were used to characterize the surface of zinc oxide (ZnO) nanorods before and after being treated with a combination of oxygen plasma treatment and acid etching. The observed results suggested that the surface of ZnO nanorods was not oxidized completely by the oxygen plasma treatment, and the zinc was transformed from ZnO

to Zn²⁺ via a reaction with oxygen-containing species. Moreover, the plasma-treated ZnO nanorods exhibited improved resistance against hydrolysis. The as-grown ZnO nanorods were mainly composed of octahedral ZnO nanocrystals with a diameter of 10 nm, and the octahedral-to-tetrahedral ratio was increased from 8.1% to 15.5%. The pH value and surface morphology played a significant role in controlling the hydrolysis rate. The hydrolysis rate increased with increasing pH value and exhibited a downward trend with the increasing surface roughness. When the pH value was below 4.0 and the surface was smooth, the as-grown ZnO nanorods were partially hydrolyzed within 96 h. However, when the pH value was above 4.0 and the surface was rough, the hydrolysis rate was decreased from the beginning of the experiment, and the hydrolysis time was as long as 96 h.## Seduction This is a component for the [82157476af
